Exercise 8 (10 points) - can be done in pair or individually

- The first lines of all source files must be comments containing names & IDs of all members. Also create file readme.txt containing names & IDs of all members
- Put all files (source, input, readme.txt) in folder Ex8_xxx where xxx = ID of the group representative, i.e. your source files must be in package Ex8_xxx (assumedly in Maven's src/main/java). Input files must be read from this path
- The group representative zips Ex8_xxx & submits it to Google Classroom. The other members submit only readme.txt. Email submission is not accepted

1. Complete classes <u>FlagFeatureMap</u>. Modify it as needed, but don't change the visibility of the given members.

```
class FlagFeatureMap {
    // Key = feature, Value = set of countries
    private TreeMap<String, LinkedHashSet<String>> workingMap;
    private LinkedHashSet<String> allCountries;

public void includeCountries(ArrayList<String> wantedFeatures) {
        // Get set of countries using each wanted feature as a key
        // Use set operations to include countries whose flags have wanted features
    }

public void excludeCountries(ArrayList<String> unwantedFeatures) {
        // Get set of countries using each unwanted feature as a key
        // Use set operations to exclude countries whose flags have unwanted features
    }
}
```

- 2. Write a main class to do the following:
- 2.1 Read data from flags.txt into workingMap and allCountries. Each input line consists
 of country name, followed by flag features (color, stars, crescent, sun)

```
flags.txt
Thailand, red, white, blue
Armenia, red, blue, orange
Azerbaijan, light_blue, red, green, white, stars, crescent
Bhutan, orange, red, white
Malaysia, red, white, blue, stars, crescent
```

- 2.2 Print the content of workingMap
- 2.3 Ask user for wanted and unwanted flag features. Call FlagFeatureMap's methods to:
 - List all countries whose flags have wanted features
 - Remove countries whose flags have unwanted features. List remaining countries
 - Features not existing as keys in workingMap are ignored. You may need to check this before applying set operations to avoid runtime exception
- 2.4 Program must be able to loop for new queries from user
